

WINGSPAN

A trading helper that knows when to say no.

SOMEONE WHO TRADES OPTIONS ON THEIR PHONE AFTER WORK

TUESDAY · TRADING APP
 **Your call options are up 38% today**

THURSDAY · TRADING APP
 **Down \$1,240** this week

THURSDAY · 3:52 PM
 **Doubles the next bet to make it back**

That last move is the one that empties accounts. And a person can't stop themselves at 3:52.

This is not one person's bad week.

\$2.1B

**lost by everyday options
traders in twenty months**

Most of it was the cost of trading, not bad
picks. Journal of Finance, 2023.

60%

**of same-day S&P 500 option
trades now come from
everyday traders**

Cboe, 2025. Record volume six years
running.

2x

**after a losing streak, people
bet bigger and more often**

The pattern behavior research finds again
and again.

The problem isn't picking stocks. It's how much, when to get out, and knowing when to do nothing.

Wingspan does the boring part perfectly.

THE AI HAS IDEAS

“I think **AT&T** stays flat or drifts up for a few weeks. I'm about **70%** sure.”

THE RULES DECIDE EVERYTHING ELSE

How much never more than \$3,000 at risk

When to get out take the win, cut the loss, on a clock

When to do nothing most days

The AI never touches the money. It can't place an order, pick a size, or move a stop.

Engine one: a small, capped bet that the AI's idea holds.

1

Every morning, one question

The AI reads six weeks of prices for thirteen well-known stocks and answers: **is there a bet here, and how sure am I?** That's all it's allowed to say.

2

The rules build the bet

Sell a contract five to six weeks out at a price the stock **probably won't reach**, and collect a fee. Buy a second contract behind it so **the most you can lose is fixed** before the order goes out.

keep the fee

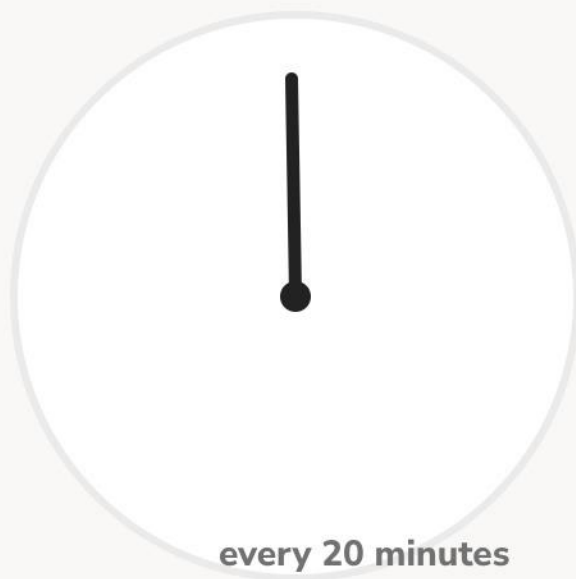

3

Five checks, any one says no

Sure enough? Not already in this stock? Small enough? Far enough from today's price? And **cheap enough to get out of** if it goes wrong. Most ideas stop here.

Getting out is decided by a clock and three rules. No AI.

Take the win at half

when the contract is worth half the fee you collected, buy it back

Cut the loss at double

only after 10 am, and only when two checks in a row agree

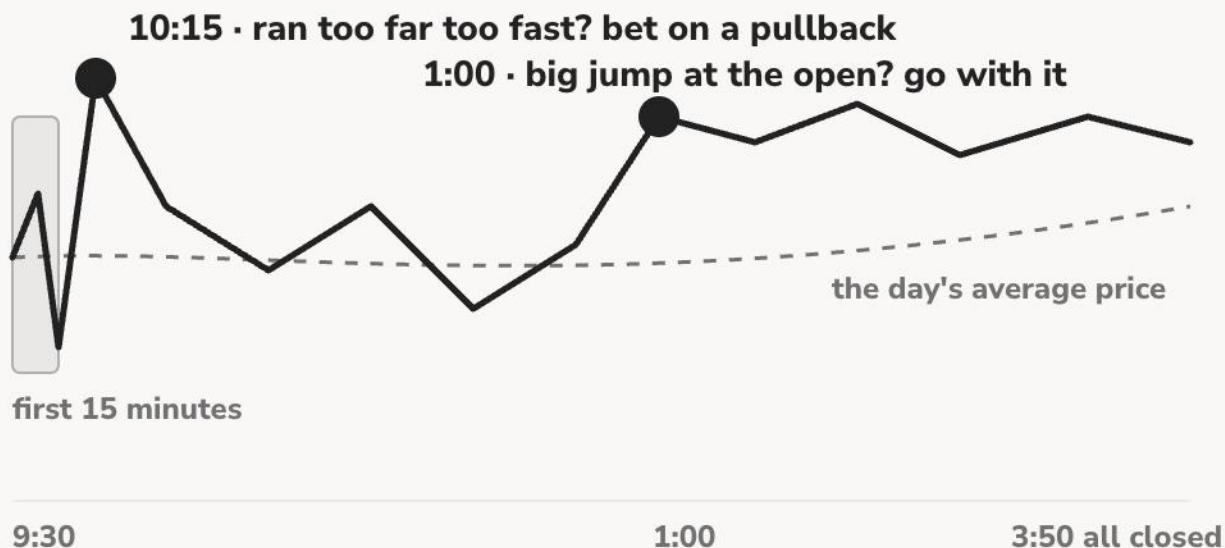

Never hold the last three weeks

that's when small moves start to hurt

Same rules, every day, written before the trade, never bent after it.

Engine two trades shares. No AI at all.

SPY and QQQ shares only

Two rules found in 6 months of data

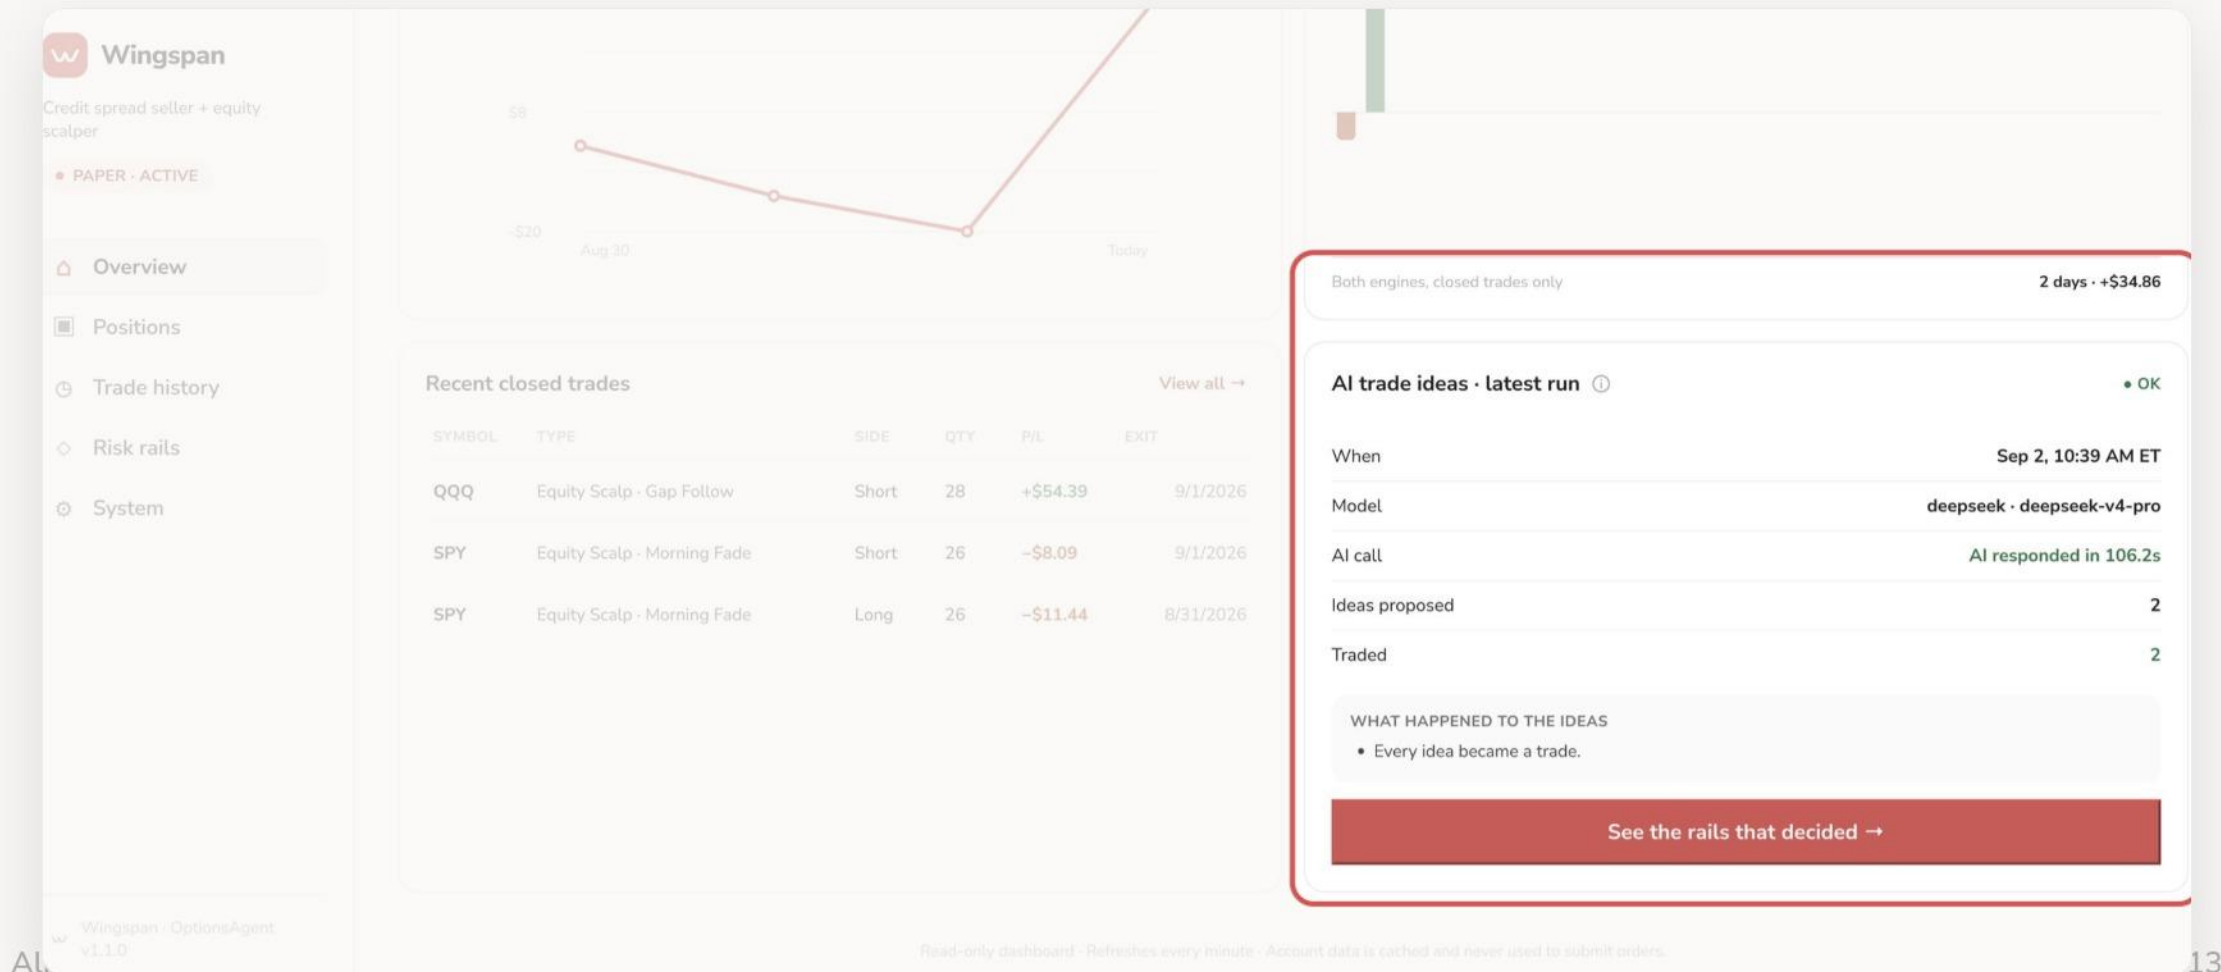

\$20,000 per trade

Out at a 0.7% loss or after 2 hours

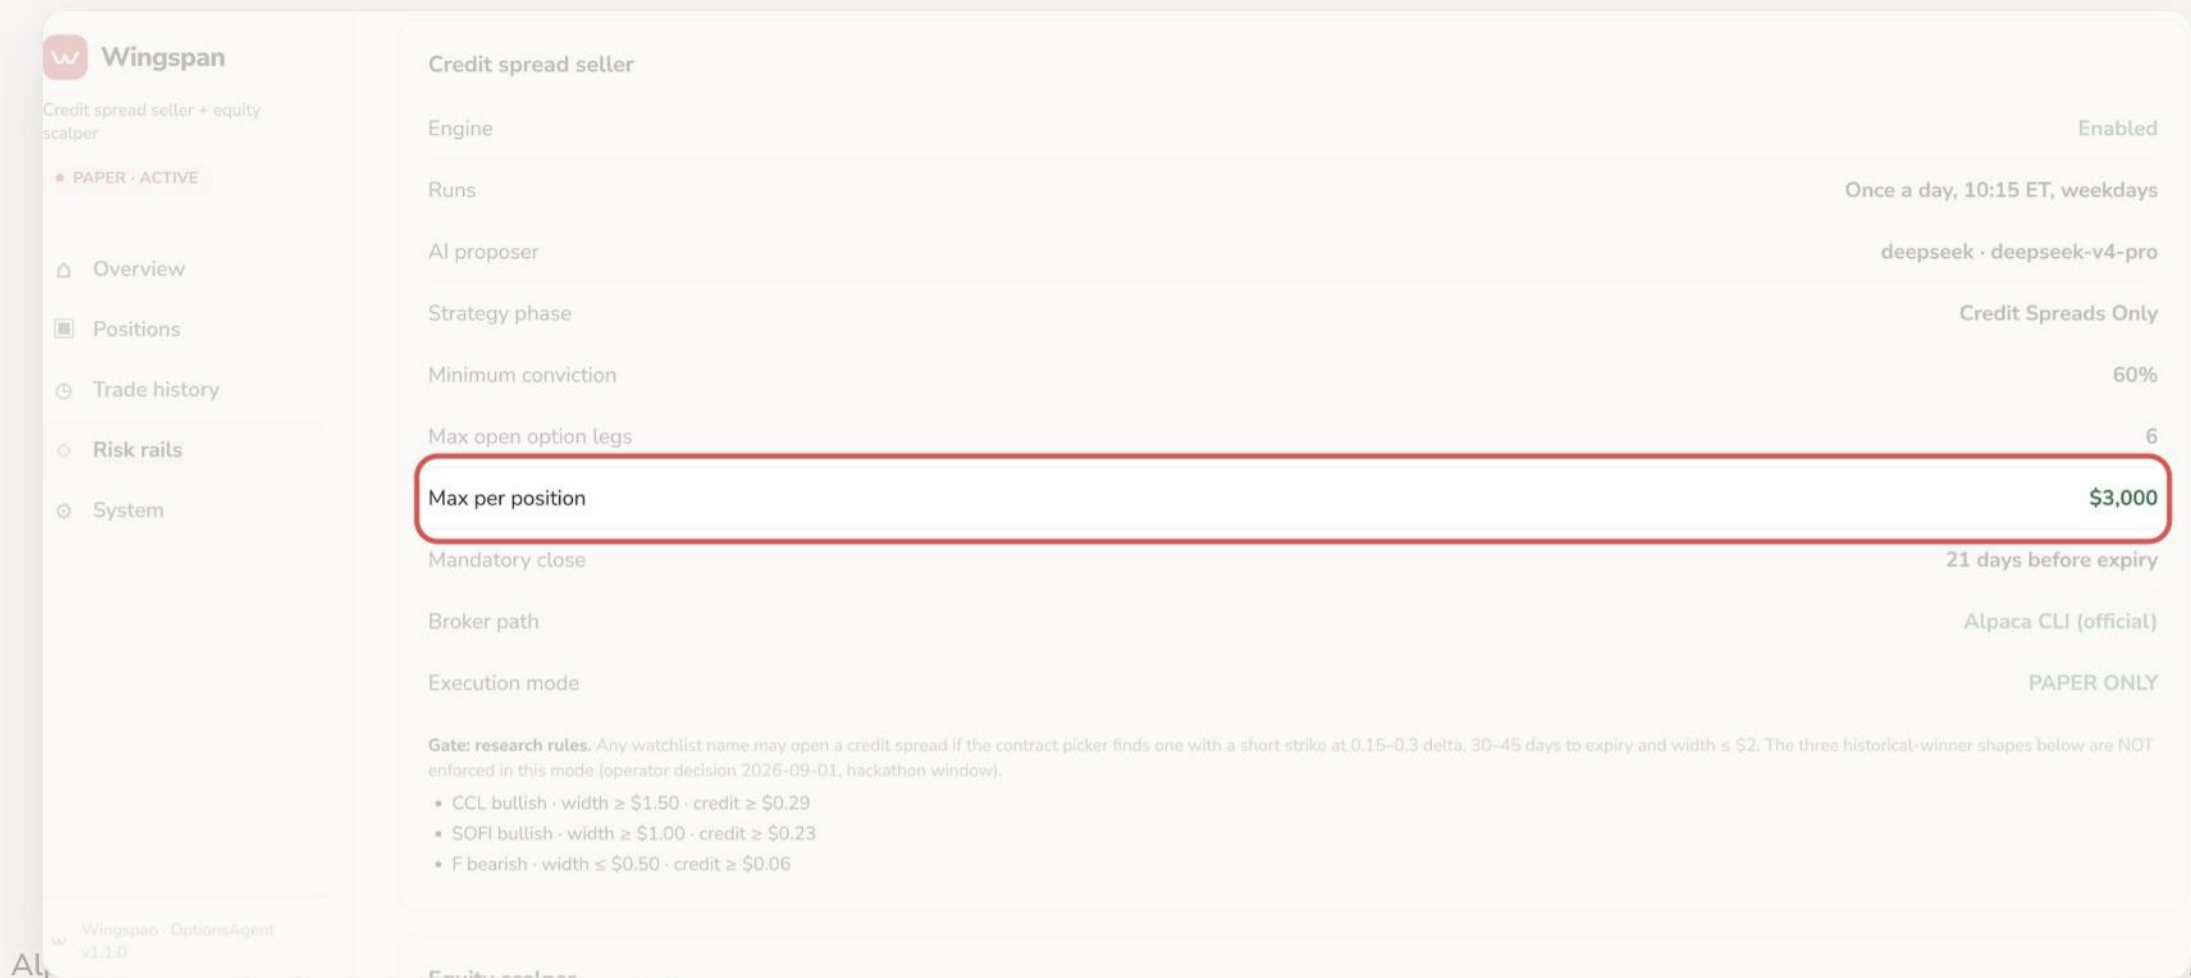

2 trades a day halts after a \$300 loss

All closed by 3:50 nothing overnight

Every idea, and every no, on one page.

The limits page reads straight from the code that trades.

Credit spread seller

Engine	Enabled
Runs	Once a day, 10:15 ET, weekdays
AI proposer	deepseek · deepseek-v4-pro
Strategy phase	Credit Spreads Only
Minimum conviction	60%
Max open option legs	6
Max per position	\$3,000
Mandatory close	21 days before expiry
Broker path	Alpaca CLI (official)
Execution mode	PAPER ONLY

Gate: research rules. Any watchlist name may open a credit spread if the contract picker finds one with a short strike at 0.15–0.3 delta, 30–45 days to expiry and width $\leq$ \$2. The three historical-winner shapes below are NOT enforced in this mode (operator decision 2026-09-01, hackathon window).

- CCL bullish · width $\geq$ \$1.50 · credit $\geq$ \$0.29
- SOFI bullish · width $\geq$ \$1.00 · credit $\geq$ \$0.23
- F bearish · width $\leq$ \$0.50 · credit $\geq$ \$0.06

Wingspan · OptionsAgent v1.1.0

Every order goes out through Alpaca's own command line tool.

...

```
$ alpaca order submit --order-class mleg --qty 15 --type limit --limit-price=-0.28 --time-in-force day --legs '[{"symbol":"T261002C00030000","side":"sell","ratio_qty":"1"}, {"symbol":"T261002C00032000","side":"buy","ratio_qty":"1"}]'
```

```
{
  "id": "1c9e...a4f2", "client_order_id": "oa-4dacc2da-8f31c0e2",
  "order_class": "mleg", "status": "accepted", "legs": 2
}
```

```
data/cli_calls.jsonl · {"argv":["alpaca","order","submit",...],"ok":true,"exit_code":0,"ms":171}
```

If the tool fails, nothing opens. There is no backup path for new bets.

We replayed a real day before betting. It found a bug.

23 bets the old rules would have made

0

losers on arrival

8 were losers the moment they opened: the price to get out was more than the fee coming in.

Fixed how the pair is chosen, added the last check: 15 bets allowed, 0 losers on arrival.

276 automated tests · replay of the Sept 1 option prices

What it is, and what it isn't.

IT IS

A discipline machine. It puts the same small, capped bet on the same rules every day, and it writes down every idea it turned away, so you can check its work.

IT ISN'T

A money printer. Two days on a practice account is not a track record. What you can verify today is the behavior: how it sizes, how it exits, and how often it says no.

Every idea, and every no, is on the dashboard. Live.

optionsagent-production.up.railway.app

Practice account, \$100,000 start. Watch it decide, and watch it say no.
