

Two distinct engines run side by side on a single \$100,000 Alpaca paper account. Claude proposes candidate trade ideas while deterministic Python code enforces every risk gate, sizing rule, and order parameter. Most days nothing trades, and that is by design.

Engine 1, Credit-Spread Seller

Daily Swing

Weekdays 10:15 to 10:27 ET (Once daily, locked window)

- Claude proposes ticker, direction, conviction (0.0 to 1.0), and thesis; Python selects strikes, deltas, and sizing.
- Sells 30 to 45 DTE credit spreads (15 to 30 delta, max \$2.00 width) on a 13-ticker liquid watchlist.
- Winner profile gate vetoes setups unless matching hard-coded CCL put, SOFI put, or F call criteria.
- Automated 20-min sweeps: 50% profit, 2x credit stop (confirmed across two sweeps), or 21 DTE close.

Engine 2, ODTE Scalper

Intraday Momentum

Every minute 09:33 to 15:59 ET (Entries cut off at 11:30 ET)

- Zero LLM dependency; pure deterministic opening range breakout (ORB) on SPY and QQQ same-day contracts.
- Enters on 1-min close outside 09:30 to 09:33 range with 1.5x volume, confirmed by next bar and VWAP.
- Strict caps: \$250 fixed per trade, max 2 trades daily, one open at a time, no entries at/after 11:30 ET.
- Fast exits: +50% target, -30% to -60% trailing stop, 15-min theta cut, and mandatory 15:50 ET flat.

LIVE STATUS Today, Aug 28 Live Account Log

- Claude proposed 8 spreads; the rails executed 0 (3 no matching contract, 5 failed the winner profile). Vetoing everything is the system working.
- The exit sweep closed July's SOFI spread for +\$26.58.
- The scalper was armed at 12:25 ET after its data feed was verified real-time to the minute.

THE FOUR "NEVER" RULES

INVARIANT

Never let model output pick a strike, delta, or expiration.

INVARIANT

Never loosen a rail by editing config (env vars may only tighten).

INVARIANT

Never place a live-money order.

INVARIANT

Never buy options after an extended move (anti-chase rule).

1. Is this real money?

No, Alpaca paper only. The code refuses non-paper endpoints at startup and connection time.

2. What exactly does the LLM control?

The idea only (ticker, direction, conviction, thesis). Output is schema-checked; malformed data is dropped. The scalper uses no LLM at all.

3. Why credit spreads?

Day one a MARA long put lost 37.6% of its premium in a session. The bot pivoted to selling defined-risk premium with a width-capped worst case.

4. How does sizing work?

Conviction-scaled share of free buying power; 30% at the 0.60 floor to 100% at 0.85+. If sizing falls below one contract, the trade is skipped.

5. 100% of buying power sounds aggressive.

Deliberate policy. The brakes are the \$2 width cap, 6 positions, broker margin rejection, and a tighten-only kill switch (OA_MAX_POSITION_USD).

6. What is the winner profile gate?

Three replayed winners (CCL put spread, SOFI put spread, F call spread), hard-coded and fail-closed. A frozen in-sample profile held unchanged to collect honest out-of-sample evidence.

7. Walk me through the exits.

Seller: 50% profit, 2x credit stop confirmed across two sweeps starting 10:00 ET, 21 DTE close, dividend check. Scalper: +50% target, -30% or -60% stop, 15-minute theta cut, 15:50 flatten.

8. Assignment and overnight gap risk?

Verticals are defined risk; max loss is width minus credit. The stop is loss control, not a guarantee. Worst day near \$1,200. The scalper never holds overnight.

9. Is there a daily loss limit?

The seller has none, relying on structural position brakes. The scalper is bounded at 2 x \$250 before exits, with an optional emergency halt switch.

10. What does the ODTE scalper actually do?

Watches SPY and QQQ 09:30 to 09:33 range. Enters on 1-minute close outside range on 1.5x volume, confirmed by next bar and VWAP. Buys \$250 ATM contracts, exiting on targets, stops, 15-minute theta, or 15:50 ET.

11. How do I know what it did on any given day?

Read-only local dashboard at 127.0.0.1:8765, plus data/decisions.jsonl and data/structures.jsonl for the seller, data/scalp_decisions.jsonl and data/scalp_positions.jsonl for the scalper.

12. What stops a bug from doing something catastrophic?

Rails hard-coded in Python, env may only tighten. Broker client refuses non-paper, entry windows are locked, sweeps reconcile live registries, and the scalper force-flattens at 15:50 ET and re-adopts orphans.
