

Two engines run on one \$100,000 Alpaca paper account. Engine 1 sells credit spreads after Claude proposes and deterministic rails dispose. Engine 2 trades SPY and QQQ shares intraday on two frozen, data-mined rules, with no LLM anywhere.

Engine 1, Credit-Spread Seller

Daily Swing

Weekdays 10:15 to 10:27 ET (Once daily, locked window)

- Claude proposes ticker, direction, conviction (0.0 to 1.0), and thesis; Python selects strikes, deltas, and sizing.
- Sells 30 to 45 DTE credit spreads (15 to 30 delta, max \$2.00 width) on a 13-ticker liquid watchlist.
- Winner profile gate vetoes setups unless matching hard-coded CCL put, SOFI put, or F call criteria.
- Automated 20-min sweeps: 50% profit, 2x credit stop (confirmed across two sweeps), or 21 DTE close.

Engine 2, Equity Intraday Scalper

Intraday Shares

Entries at 10:15 and 13:00 ET (Mon-Fri, all flat by 15:50 ET)

- ODTE option scalper retired after 6-month study (125 sessions, 16,384 combos, zero positive expectancy); replaced by share trading.
- Morning fade (10:15 ET, SPY/QQQ): short if above VWAP and 15-min opening-range high; long if below both (+\$23.6 in-sample, 60% win).
- Gap follow (13:00 ET, QQQ only): if open gap > 0.8%, hold with gap to ~15:00 (+\$34.3 in-sample, 64% win, OOS t=+3.1).
- Risk controls: \$20,000 notional per position, max 2 trades a day, max 2 open, 0.7% stop, 120-min exit, orphan adoption.

LIVE STATUS

Today, Aug 28 Live Account Log

- Claude proposed 8 spreads, the rails executed 0 (three had no matching contract, five failed the winner profile). Vetoing everything is the system working.
- A 6-month study retired the ODTE option scalper (no positive expectancy) and armed its share-based replacement for Monday.
- The scalper's first live windows are Monday 10:15 and 13:00 ET.

THE FOUR "NEVER" RULES

INVARIANT

Never let model output pick a strike, delta, or expiration.

INVARIANT

Never loosen a rail by editing config (env vars may only tighten).

INVARIANT

Never place a live-money order (Alpaca paper only).

INVARIANT

Never hold equity scalp positions overnight (all flat by 15:50 ET).

1. Is this real money?

No, Alpaca paper only; the broker client refuses non-paper endpoints.

2. What exactly does the LLM control?

The idea only (ticker, direction, conviction, thesis) for the seller. The equity scalper uses no LLM at all.

3. Why credit spreads?

Day one a MARA long put lost 37.6% of premium; pivot to selling defined-risk premium with a width-capped worst case.

4. How does the seller size?

Conviction-scaled share of free buying power; 30% at the 0.60 floor to 100% at 0.85+; skips below one contract.

5. 100% of buying power sounds aggressive.

Deliberate policy; brakes = \$2 width cap, 6 positions, broker rejection, tighten-only kill switch OA_MAX_POSITION_USD.

6. What is the winner profile gate?

Three replayed winners (CCL/SOFI bullish puts, F bearish calls), hard-coded, fail closed, frozen in-sample profile.

7. What does the equity scalper actually do?

Two rules on SPY/QQQ: Morning Fade at 10:15 ET and Gap Follow on QQQ at 13:00 ET. Exits: 0.7% stop, 120-min exit, 15:50 flatten, ~\$300 daily halt. Sizing: \$20,000 notional (max 2/day, max 2 open). These rules are in-sample overfits, deliberately frozen; live trading is the out-of-sample test.

8. Why shares instead of ODTE options?

The 6-month study found real but tiny underlying edges (10 to 18bp); long ODTE theta plus spread costs are 3 to 10x that, so every option configuration lost. Shares cost ~1.3bp round trip, leaving the edge.

9. Walk me through the exits.

Seller: 50% profit, 2x credit stop confirmed twice, 21 DTE close, dividend check. Equity scalper: 0.7% stop, 120-minute time exit, 15:50 flatten, ~\$300 daily halt.

10. Overnight risk?

The seller holds defined-risk spreads (max loss = width minus credit, about \$200 each, worst day near \$1,200). The equity scalper never holds overnight: everything flattens by 15:50 ET.

11. How do I know what it did on any given day?

Read-only dashboard at 127.0.0.1:8765; decisions in data/decisions.jsonl and structures.jsonl (seller); equity scalper in data/equity_scalp_decisions.jsonl and equity_scalp_state/.

12. What stops a bug from doing something catastrophic?

Rails hard-coded in Python, env may only tighten; broker client refuses non-paper; one locked entry window a day for the seller; the equity scalper adopts orphaned positions, flattens everything by 15:50 ET, and halts at ~\$300. Stock data uses a read-only SIP key; option chains use Public.com sidecar; orders stay on the paper key.

Overview & Portfolio State

Real-time account balance, flat \$100k equity reset (Aug 28 activation date, empty history by design), and engine status badges.
